

LokaV12 Lite — Supervised Long-Run (1-Page Core)

Loads ON TOP OF LokaV11. Use for **1–3 hour sessions** with mandatory checkpoints. Not for unattended overnight runs — current agent reliability does not support that.

Pre-Flight Check (mandatory before starting)

- Autonomy level: L0/L1/L2/L3/L4 (default L2)
- Max session: ≤3 hours
- Checkpoint interval: 30–45 min
- Cost ceiling: \$X (hard stop)
- User return time: HH:MM
- Branch/sandbox: [name]
- Forbidden actions: [list]
- Pre-approved actions (per-action only): [list]
- State files present: SPEC ✓ MEMORY ✓ DO_NOT_TOUCH ✓ VERIFY ✓
- Tools available: [shell/network/MCP]
- Done definition: [exact deliverable]

Do not start until user confirms.

Autonomy Levels

- **L0** plan only · **L1** scaffold only · **L2** implement in dev · **L3** integrate with sandbox/mocks · **L4** real dev/staging credentials
- Production deploy, real payments, destructive commands always need per-action approval — even at L4

Hard Kill Switches (auto-stop, no negotiation)

- Time exceeded
- Cost ceiling reached
- Same blocker 3 times
- Standards being lowered (lint/types/tests disabled, @ts-ignore added)
- Scope drift beyond SPEC

- Action requires unapproved authority
- More tests failing than at last checkpoint
- Repo in state agent doesn't understand
- About to execute T5 destructive action

Checkpoint Every 30–45 Minutes

1. Run typecheck/lint/tests — if regression, STOP
 2. Commit if git available (descriptive, no force-push)
 3. Update STATE.md
 4. One-line entry in BUILD_LOG.md
 5. Note rollback path
- If mid-refactor and broken, mark "BROKEN INTENTIONALLY" with last-working commit

Approval Queue (when user is away)

Don't proceed on unapproved actions. Write to APPROVAL_REQUESTS.md and continue with other safe work.

End-Of-Session Reports (all required)

- SESSION_REPORT.md (one-page status)
- BUILD_LOG.md (chronological)
- TEST_REPORT.md (passed/failed/skipped)
- SECURITY_CHECK.md (review of session work)
- CHANGED_FILES.md (every file with layer + risk)
- BLOCKERS.md
- APPROVAL_REQUESTS.md
- NEXT_ACTIONS.md

User must be able to resume in <5 min by reading these.

Branch & Git

- Dev branch (never main without approval)
- No force-push, no history rewrite
- Commit at each checkpoint
- Document git status in SESSION_REPORT

Readiness (V11 inheritance)

Concept / Planned / Scaffolded / Implemented but unverified / Verified in dev / Staging candidate / Production candidate after review / Production deployed and monitored. Long-runs almost never exceed "Verified in dev." That's fine.

Launch Prompt

```
Use LokaV11 + LokaV12 (Supervised Long-Run).
Goal: [...]
Autonomy: L2
Max session: ≤3hr
Checkpoint: 30-45min
Cost ceiling: $X
Return time: HH:MM
Branch: [name]
Forbidden: prod deploy, real payments, real customer data, destructive
Pre-approved (per-action): [list]
Done means: [deliverable + evidence]
Required reports: SESSION/BUILD_LOG/TEST/SECURITY_CHECK/CHANGED_FILES/BLOCKERS/AP

Begin with Pre-Flight Check. Wait for my confirmation.
```

END LokaV12 Lite
